i'm dropping this quick preview of the full IDE i've been cooking up. it consist of a main ts wrapper, with local back end servers for bt-python and usb high tansferts and webbt for slower bt transmissstions.

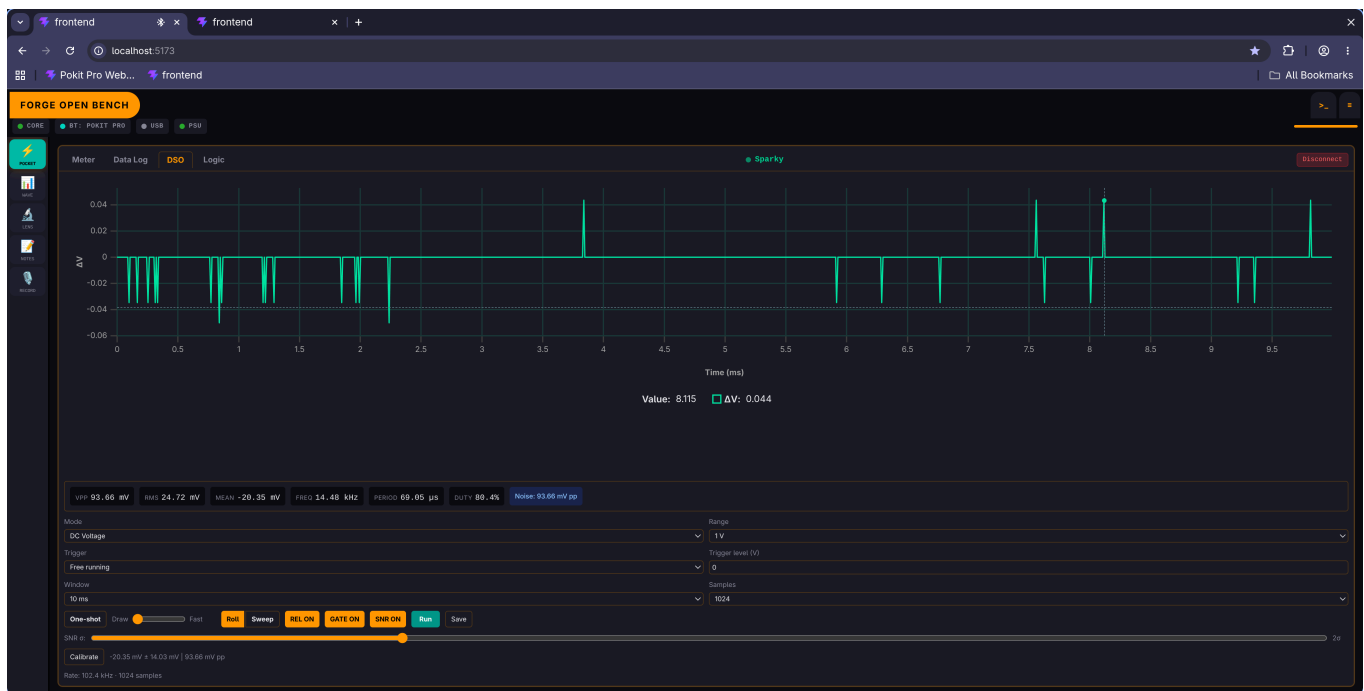

It all started with wanting my own pokit pc version of their apk. After a ...year of dreaming, here i am. The gui is my final merger of the pokit web bt gui repo i sent out to some of you already. Pocket addons, now has full meter, dso, logic analyser done.

On to the IDE side of the project, i have made a kind of jupyter like note addons, that acts as the organiser to make a project folder, add the lens webcam outputs images to it, still need to work on adding overlays on pics to add notes such as pins and traces, etc.

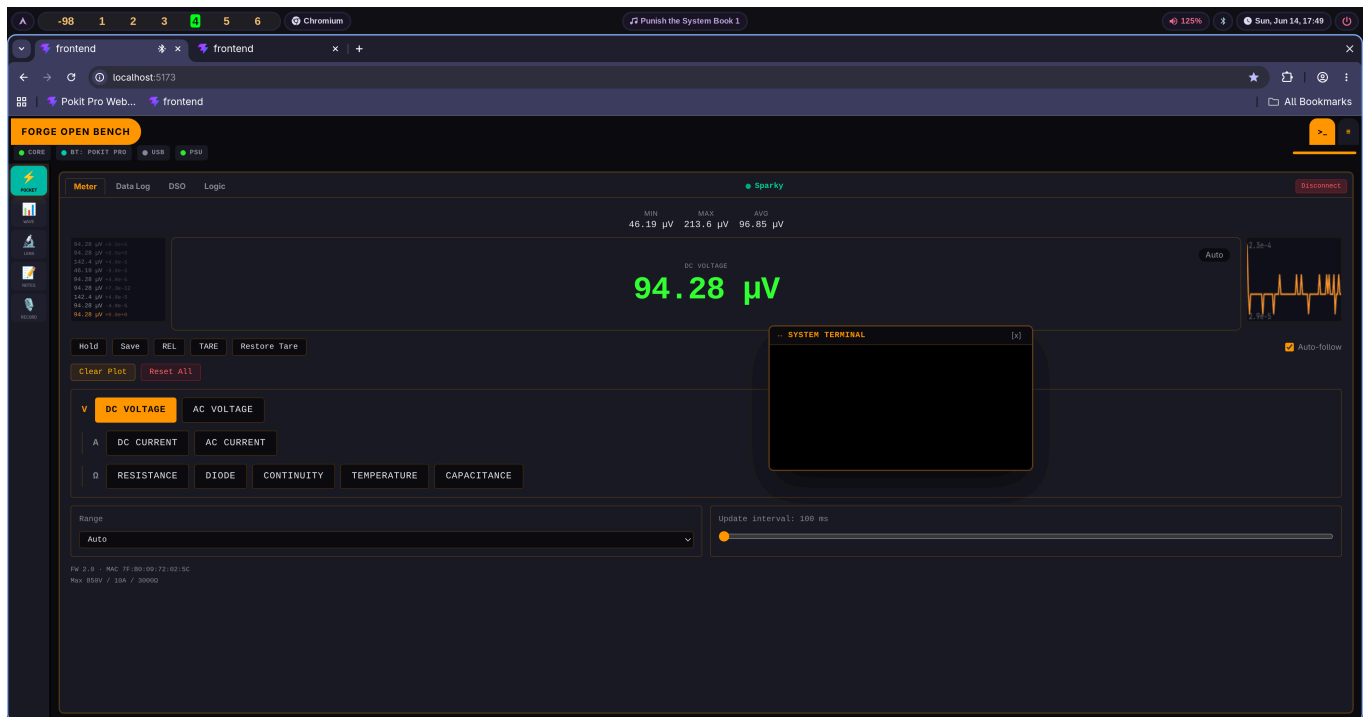

i will let these first few picture explain it all:

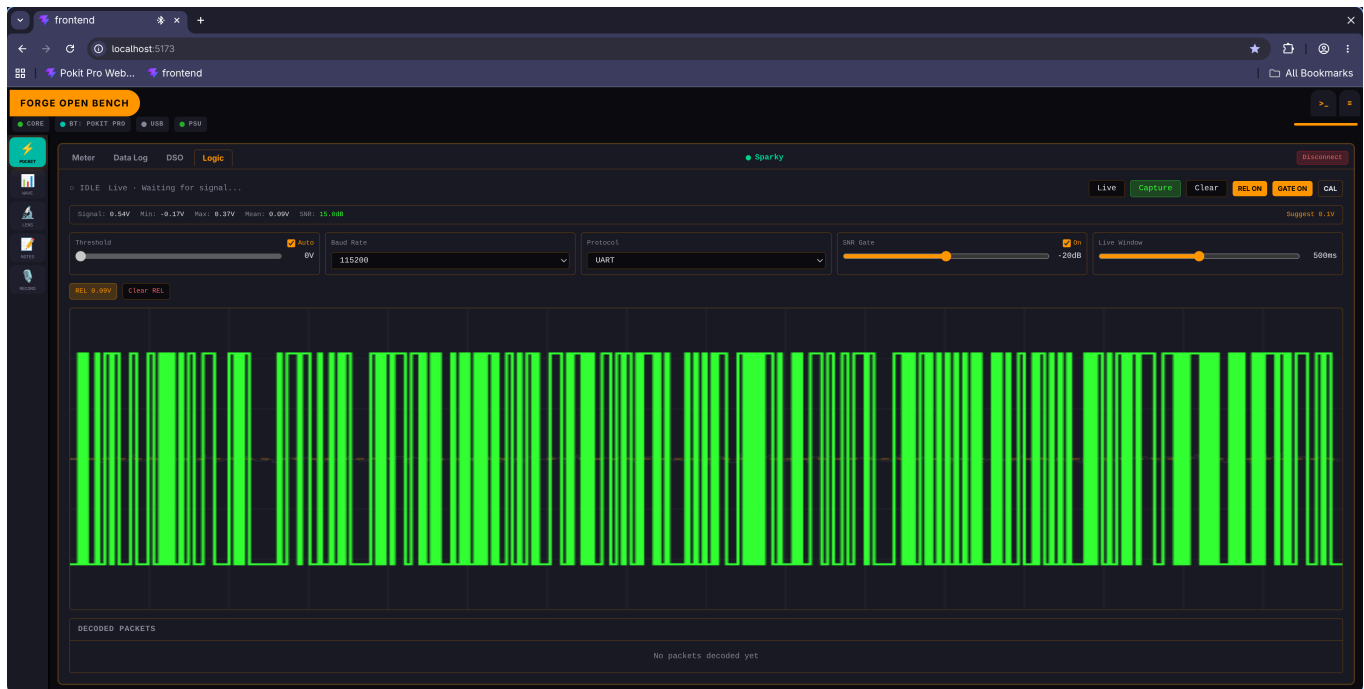

did i mention it has a floating terminal window inside?

logic tab is almost done, still fixing the logic in it.

and the ui for it, maybe like in meter, a decoder ticker vertical, timestamped. still got a few details to push through in my head.

i'm pasting this here, to seek your thoughts, you interest in such a IDE, not a speech to ask for help, more like testers or reviewers maybe? i honestly am running too fast now to stop often. would make for poor communications.

next part coming up is the python-bt bridge for higher throughput. After that comes the fun part, a usb hantek6622bl 16channels and dual dso probes!
